A World Of Automation

Dc Power Supply's and Control Panel Building

All electrical control panels are designed and built in house at CTS and are comply with all current IEEE and EU directives and standards. The circuits are subjected to

comprehensive quality checks prior to functional testing. All PLC programs are

written and pre tested using our diagnostic software before installation or supply. Each panel comes complete with all relevant documentation drawings and circuit diagrams, as well as a full and comprehensive service manual.. Installation of all relevant services and control cabling is done to a high standard and in line with Bsi approvals. Fully tested and certified on completion to current regulations .

Integral DC Power Supply's

For high quality, cost effective solutions for standard DC voltage and Current power supply's in any type of environment, CTS has developed another great cost effective solution. Offering a

range of fully controlled power supply's to match standard applications (Typical 200v dc 180A model shown) or tailored to suit individual requirements. Controlled via RS232C

comms direct from the PLC and HMI gives not only reliability and maintainability but allows

easy access from any medium. The standard applet provided allows any PC at any location to gain access (with password protection) to monitor and operate as if you were touching the screen yourself. A modem is installed

as part of the package. Why not ask for a demonstration, seen operating in China. This new product line is our lat-

est cost effective solution starting from just £12,000.00GBP plus power packs as required.
